

“Spectrum” is the official organ of the Irish Bio-Medical & Clinical Engineering Association.

The role of the bio-medical engineer is varied. It can range from the hospital engineer, who specifies, commissions and maintains complex medical equipment to professionals working alongside the medical specialist.

As the lines between the engineer and the medical practitioner become more blurred, it can involve design and manufacture of joint replacement components, heart pacemakers, stents and implants.

The mailing list encompasses every decision maker in the industry, as well as the medical professionals who practice in this exciting field.
